Amendments to the Claims

Listing of Claims:

1. (Currently amended) A distributed network comprising:

a plurality of processors,

a local counter associated with each of the processors in the distributed network;

an event register associated with each of the local counters; and

an event logger for receiving a counter value from the local counter in response to an

event being registered in the event register; and

software for performing conditional probability calculations based on event information

stored in a history table wherein the conditional probability calculations are performed to

determine if a probability of an event occurring has exceeded a minimum threshold level and, if

the threshold is exceeded, to migrate a process or schedule maintenance to avoid consequences

of a predicted event;

wherein the conditional probability calculations are based upon events occurring within a

selected time window.

2. (Original) The distributed network of claim 1 comprising a global clock wherein a time stamp

is calculated based on the counter value received from a counter associated with a processor in

the distributed network.

3. (Original) The distributed network of claim 1 wherein the event logger records data

concerning a type of event registered by the event register and a time an event occurred.

4. (Original) The distributed network of claim 1 wherein the event register remains frozen until

the event register is read by the system monitor.

5. (Original) The distributed network of claim 1 comprising dynamic masking mechanisms for

filtering the event register outputs to differentiate between critical and non-critical events.

6. (Currently amended) The distributed network of claim 5 wherein the masking is dynamically

updated during online processing.

7. (Canceled)

8. (Canceled)

9. (Currently amended) The distributed network of claim 1 wherein the event register comprises

an error time stamp register that receives a value from the local counter when an event occurs.

10. (Currently amended) The <u>distributed</u> network of claim 1 wherein the event register stores an

error occurred value that indicates to the network monitor that a critical event has occurred.

11. (Currently amended) A method of producing a time stamp for an event occurring on a

distributed network, the method comprising:

producing a local counter value for each of a plurality of processors in the distributed

network with an associated counter;

dynamically masking events that occur based on conditional probabilistic calculations

using machine learning algorithms to predict an occurrence of a critical event during a specified

time period

synchronizing the local counter at each of the processors with a global clock; and

freezing the local counter for a processor when a critical event associated with the

processor occurs.

12. (Original) The method of claim 11 comprising establishing a history table containing

information concerning events associated with the critical event and the conditional probabilities

of the associated events during offline processing.

13. (Original) The method of claim 12 comprising determining during an offline phase if an

event is critical and whether or not online processing is possible.

14. (Original) The method of claim 12 comprising dynamically filtering the events based on a

recorded history of information associated with the occurrence of events such that only certain

critical events produce global interrupts.

15. (Original) The method of claim 12 comprising updating the conditional probability

information and history table during offline processing.

16. (Original) The method of claim 11 comprising determining during online processing a type

of event that occurred and determining whether to produce a global alert, synch stop or machine

check alert signal based upon the type of event that occurred.

17. (Canceled)

18. (Currently amended) A distributed computer system for implementing a time stamping

process for producing a time stamp associated with an occurrence of an error event, the computer

system comprising:

a plurality of processors;

a plurality of local counters wherein each counter is associated with one of the plurality

of processors in the distributed computer system;

an event register for recording event information concerning an occurrence of an event

associated with the processor and event register; and

an event logger for receiving and logging information concerning the occurrence of the

events; and

software for performing conditional probability calculations based on event information

stored in a history table wherein the conditional probability calculations are performed to

determine if a probability of an event occurring has exceeded a minimum threshold level and, if

the threshold is exceeded, to migrate a process or schedule maintenance to avoid consequences

of a predicted event;

wherein the conditional probability calculations are based upon events occurring within a

selected time window.

19. (Original) The distributed computer system of claim 18 comprising a global clock for

synchronizing the local counters.

20. (Original) The distributed computer system of claim 19 wherein the event logger records a

time stamp based upon the global clock and a local counter value received from a local counter.

21. (Original) The distributed computer system of claim 18 comprising dynamic masks created

based upon historical event information for filtering events such that only information

concerning critical events result is stored.

22. (Original) The distributed computer system of claim 21 comprising software for evaluating

events based on conditional probabilistic calculations and scheduling remedial or preventative

action during online processing.

23. (Currently amended) A computer-executable medium comprising instructions for producing

a time stamp for an event occurring on a distributed network including a plurality of processors,

the medium comprising instructions for:

producing a local counter value for each of a plurality of processors in the distributed

network with an associated counter;

synchronizing the local counter at each of the processors with a global clock; and

freezing the local counter for a processor when an event associated with the processor

occurs; and

an instruction for dynamically masking events that occur based on conditional

probabilistic calculations using machine learning algorithms.

24. (Original) The medium of claim 23 comprising an instruction for monitoring the local

counter with a system monitor through the use of online and offline processing.

25. (Original) The medium of claim 23 comprising an instruction for periodically polling the

local counters and storing information received in a history table.

Serial Number 10/735,412

Docket Number YOR920030348US1

Amendment2 page 7 of 12

26. (Original) The medium of claim 23 comprising an instruction for dynamically filtering the

events based on a recorded history of information associated with the occurrence of events such

that only critical events are reported to a system monitor.

27. (Original) The medium of claim 23 comprising an instruction for performing conditional

probability calculations to determine if a probability that a critical event will occur exceeds a

threshold level and performing or scheduling preventative action if such threshold is exceeded.

28. (Previously Presented) The medium of claim 23 comprising an instruction for determining a

type of event that occurred and determining whether to produce a global alert, synch stop or

machine check alert signal based upon the type of event that occurred.

29. (Canceled)
